Another Extension of the Little q-Jacobi Polynomial and its Properties

Otra Extensión del q-Polinomio de Jacobi y sus Propiedades

Rajesh V. Savalia, B. I. Dave, J. C. Prajapati

1. Introducción

The little q-Jacobi polynomial is given by (2, p.161, Eq.(7.1.11))

\[ p_n(x; a, b; q) = 2\varphi_1 \left( \begin{array}{c} q^{-n}, abq^{n+1}; q, xq \\ aq; \end{array} \right), \]

we consider an extension of this polynomial in the form

\[ p_r^n(x; s, a, b; q) = \sum_{k=0}^{[n/s]} \frac{(q^{-n}; q)_s}{(aq; q)_rk} \frac{(abq^{n+1}; q)_s}{(q; q)_k} x^k q^k \]

Abstract

The little q-Jacobi polynomial is extended in this work whose properties such as fractional q-integral, q-integral representations, q-derivative, higher order q-derivative, q-Liebnitz’s formula, summation formula are obtained. Also, the Fatou’s lemma of measurable function is applied on this polynomial.

Keywords: q-polynomial, q-fractional integral, q-derivative, q-fractional derivative, Lebesgue measure.

Resumen

En este trabajo se generaliza el q-polinomio de Jacobi y se obtienen sus propiedades q-integral fraccional, q-representaciones integrales, q-derivada, q-derivada de alto orden, q-fórmula de Leibnitz y la fórmula de suma. Además, el lema de Fatou de función medible es aplicado a este polinomio.

Palabras Claves: q-polinomio, q-integral fraccional, q-derivada, q-derivada fraccional, medida de Lebesgue.
where \(|q| < 1\), and \(n\) and \(s\) are positive integers, \(r\) is any integer, and \(a\) and \(b\) are complex numbers. For this polynomial, we have obtained fractional q-integral formula, q-integral representations, q-derivative expression, higher order q-derivative, q-Liebivitz’s formula, a summation formula and a result based on Lebesgue measure over \(\mathbb{R}\).

The following formulas and definitions are used in this paper \([2]\).

The q-Factorial function is defined by,

\[
(a : q)_n = \begin{cases} 
1, & \text{if } n = 0 \\
(1 - a)(1 - aq^2) \cdots (1 - aq^{n-1}), & \text{if } n = 1, 2, 3, \ldots \\
\frac{(a : q)_n}{(aq^n : q)_\infty}, & \text{if } n \in \mathbb{C}
\end{cases}
\]

The q-Beta function is given by,

\[
\beta(x, y) = \frac{\Gamma_q(x) \Gamma_q(y)}{\Gamma_q(x + y)}
\]

where \(\Gamma_q(x)\) is the q-Gamma function.

The q-Beta function is also known as q-Leibnitz’s fractional integral formula \([6, p.187, Eq.(1.1)]\), is defined by

\[
B_q(x, y) = \int_0^1 \frac{(tq^y; q)_\infty}{(tq; q)_\infty} dt = \frac{\Gamma_q(x) \Gamma_q(y)}{\Gamma_q(x + y)}
\]

The Kober fractional integral formula \([6, p.187, Eq.(1.1)]\), which is a generalization of the Riemann-Liouville fractional integral formula \([6, p.187, Eq.(1.1)]\), is defined by

\[
I^\eta_{q, \mu} f(x) = \frac{x^{-\eta - \mu}}{\Gamma_q(\mu)} \int_0^x (x - t q)_\mu t^{\eta - \mu} f(t) d_q t,
\]

where \((x - y)_n = x^n(y/x : q)_n\), \(\text{Re}(\mu) > 0\), \(\eta \in \mathbb{R}\) and \(|q| < 1\).

Andrews and Askey’s integral is given by \([11, p.98, Eq.(1.12)]\)

\[
\int_0^\infty t^{\lambda - 1} e_q(-t) d_q t = \frac{(1 - q)}{(q^{\lambda}; q)_\infty} q^{-\lambda(\lambda - 1)/2}
\]

where \(\text{Re}(\lambda) > 0\).

Here, we find the q-derivatives of the polynomial and write the expression for a general \((m^{th})\) order. Now, compared with a general formula

\[
D^m_q f_n(x) = \frac{1}{x^m(q - 1)^m q^{m(m-1)/2}} \sum_{j=0}^{m} (-1)^j q^{(j - 1)/2} \left[ \begin{array}{c} m \\ j \end{array} \right] q \ f_n(x q^{m-j})
\]

this is due to D. S. Moak \([4, p.33, Eq.(6.9)]\), we obtained a particular summation formula connecting degree extended little q-Jacobi polynomial \([2]\) with the sum of its lower degrees. The formula is also known as q-Leibnitz’s formula. The following are the results obtained in this paper. On applying the Kober fractional integral formula \([5, 6, p.187, Eq.(1.1)]\) to the q-polynomial \((1.2)\), we have

\[
I^\eta_{q, \mu} \{ p^r_n(x ; a, b ; q) \} = \frac{x^{-1} \Gamma_q(\mu - 1)}{\Gamma_q(\mu)} \sum_{k=0}^{[\eta]_q} \binom{\eta}{q} \binom{\eta}{q} \binom{\eta}{q} \binom{\eta}{q} \binom{\eta}{q} \binom{\eta}{q} x^k
\]

Next, the following q-integral representations are derived by making use of \([6]\) and \([7]\).
If \( \int \) is an integer, \( f \) finally by using the Fatou’s lemma \[5\], p.86 we arrived at, where

\[
J_n(x, t^s; s, a, b; q) = \sum_{k=0}^{[n/2]} \frac{(q^{-n}; q)_k}{(aq; q)_k} \frac{(aqbq^{n+1}; q)_k}{(aq; q)_k} x^k t^k
\]

where \( J_n(x, t^s; s, a, b; q) \) is derived using 8 as

\[
\Phi_r(x, t^s; s, a, b; q) = \sum_{k=0}^{[n/2]} \frac{(q^{-n}; q)_k}{(aq; q)_k} \frac{(aqbq^{n+1}; q)_k}{(aq; q)_k} x^k t^k
\]

Following formula is derived using 8 as

\[
\left( \prod_{j=0}^{m-1} \frac{(q^{-n+j}; q)_j()}{(aq^{r+1}; q)_r} \right) p_n-m_{s}(x; aq^{mr}, bq^{m(2s-r)}; q) = \frac{(-1)^m}{x^{m} q^{m(m-1)/2}} \sum_{l=0}^{m} (-1)^l q^{(l-1)/2} \left[ \begin{array}{c} m \\ l \end{array} \right] p_{n-m_{s}}(xq^{m-l}; s, a, b; q)
\]

where \( m_{s} \leq n \).

Finally, by using the Fatou’s lemma \[5\], p.86 we arrived at, “If \( \{f_n\}_n \) is a sequence of non negative measurable functions and \( f_n \rightarrow f \) almost everywhere on a set \( E \), then

\[
\int_E f \leq \lim_{n \rightarrow \infty} \int_E f_n
\]

Following inequality

\[
\int_E V_r(x; s, a, b; q) dm \leq \lim_{n \rightarrow \infty} \int_E p_n(xq^{m}; s, a, b; q) dm,
\]

is derived where \( X = [-\infty, 0) \), \( \Re \) = power set of \( X \), \( m(E) \) = length of \( E \), \( \forall E \subseteq \Omega, x \in X, a > 0, b > 0, r \) is an integer, \( s \) and \( n \) are positive integers, \( 0 < q < 1 \), \( V_r(x; s, a, b; q) \) is an absolutely convergent q-series (as a \( q_{0, r} \) - series) for every \( x \) which is given by

\[
V_r(x; s, a, b; q) = \sum_{k=0}^{\infty} (-1)^k q^{sk(k-1)/2} \frac{(aq; q)_k}{(aq; q)_k} x^k t^k = \lim_{n \rightarrow \infty} p_n(xq^{m}; s, a, b; q)
\]

2. Proof of the Results

Using \[2\] and \[5\] we get

\[
I_n^a, p_n^r(x; s, a, b; q) = \frac{x-n-\mu}{\Gamma_q(\mu)} \sum_{k=0}^{[n/2]} \frac{(q^{-n}; q)_k}{(aq; q)_k} \frac{(aqbq^{n+1}; q)_k}{(aq; q)_k} k^k \int_0^x (x-tq)_{\mu-1} t^{n+k} dt^k
\]

39
The q-derivative of the polynomial 2 is

Now, using 2 and 6, we get

Similarly, second order q-derivative is given by

Next, the q-derivative operator is defined \[2\] as

where

The following q-integral representation is obtained by making use of 2 and 7

where

Next, the q-derivative operator is defined \[2\] as

The q-derivative of the polynomial \[2\] is

Similarly, second order q-derivative is given by

In general, if \( sm < -n \), then \( m^{th} \) order q-derivative is given by

\[ D_q^m \{p_n^r(x; s, a, b; q)\} = \frac{1}{(1-q)^m} \left( \prod_{j=0}^{m-1} \frac{(q^{-n+j}; q)_s (aq^{-n+j+1}; q)_s}{(aq^{j+1}; q)_r} \right) p_{n-m}^r(x; aq^{mr}, bq^{m(2s-r)}; q). \]

On making use of [8] and [16] the summation formula obtained as

\[ p_{n-m}^r(x; aq^{mr}, bq^{m(2s-r)}; q) = \frac{(-1)^m}{x^m q^{m(m-1)/2}} \sum_{i=0}^{m} (-1)^i q^{i(i-1)/2} \left[ \begin{array}{c} m \\ i \end{array} \right] p_{n-m}^r(xq^{m-i}; s, a, b; q). \]

We know that a polynomial is a continuous function and hence, is measurable function [5]. Thus the polynomial [2] is a measurable function. If \{f_n(x)\} is sequence of measurable functions and converges to \( f(x) \) then \( f(x) \) is measurable function [5]. Now, we have

\[ p_n^r(xq^n; s, a, b; q) \rightarrow V_r(x; s, a, b; q) \quad \text{as} \quad n \rightarrow \infty, \]

where \( V_r(x; s, a, b; q) = \sum_{k=0}^{\infty} (-1)^k q^{sk(k-1)/2} \left( \frac{aq}{q} \right)_r \left( \frac{q}{q} \right)_s x^k q^k \).

Now, consider the Lebesgue measure space \( X, \mathcal{M}, m, \) where \( m(E) = \text{length of } E, \forall E \in \Omega, x \in X, a > 0, b > 0, r \) is an integer, \( s \) and \( n \) are positive integers, and \( 0 < q < 1 \), then \( \{p_n^r(xq^n; s, a, b; q)\}_1^\infty \) becomes a sequence of non negative measurable functions. Hence, \( \{p_n^r(xq^n; s, a, b; q)\}_1^\infty \) will also be a sequence of non negative measurable functions, and as \( n \rightarrow \infty \), \( p_n^r(xq^n; s, a, b; q) \rightarrow V_r(x; s, a, b; q) \) almost everywhere. Hence, by using Fatou’s lemma, we get the inequality:

\[ \int_E V_r(x; s, a, b; q) \, dm \leq \lim_{n \rightarrow \infty} \int_E p_n^r(xq^n; s, a, b; q) \, dm \]  

3. Conclusion

The results obtained in this paper are seems to be new and quite interesting for the scope of further research. These results give the connection between Measure theory and Special Functions in particular q-analogue.
